

How to Edit Videos in Minutes with Claude Code + Remotion

A Free Guide from Seedscale Agency

Stop spending hours manually cutting out silences, retakes, and false starts from your talking-head videos. With Claude Code and Remotion, you can go from raw footage to a polished, captioned short-form video in minutes — with your brand style baked in.

What You'll Need

- Claude Code — Anthropic's CLI tool
- Node.js v18+ installed
- Raw video footage (.mov or .mp4)
- ~10 minutes for first-time setup, ~5 minutes per video after that

One-Time Setup (10 minutes)

Step 1: Install the Remotion Skill

The Remotion skill gives Claude Code domain-specific knowledge about video editing with Remotion. Install it from GitHub:

```
git clone --depth 1 https://github.com/remotion-dev/skills.git
/tmp/remotion-skills
mkdir -p ~/.claude/skills
cp -r /tmp/remotion-skills/skills/remotion ~/.claude/skills/remotion
rm -rf /tmp/remotion-skills
```

Step 2: Create Your Brand Guide

Inside ~/.claude/skills/remotion/rules/, create a brand-guide.md file that defines your visual style:

- Fonts — typeface, weights, and sizes for titles, subtitles, and captions
- Colors — title color, caption color, highlight color, accent elements
- Layout — where titles go, where captions go, platform safe zones

- Icons/accents — any decorative elements (starburst, logos, etc.)

You can ask Claude Code to help you build this: just show it a screenshot of your existing content and say 'match this style.'

Step 3: Set Up Retake Detection Rules

Create a retake-detection.md rule file that tells Claude how you signal retakes: a keyword like 'retake,' repeated sentences, false starts, or silence thresholds. Claude Code will follow these rules every time it processes your footage.

Per-Video Workflow (5 minutes)

Step 1: Start a New Conversation

Open Claude Code in your terminal. If you don't have a Remotion project yet, Claude will scaffold one for you.

Step 2: Drop In Your Footage

Tell Claude: "New video — edit this with my brand style" and reference your raw footage file. Claude will:

1. Copy your video into the project's public/ folder
2. Analyze the audio — measure loudness levels and detect all silent segments
3. Transcribe your speech using Whisper (runs locally, no API needed)
4. Detect cuts — find retake markers, repeated sentences, false starts, and long pauses
5. Build the composition — stitch together only the good segments
6. Add branded titles — your fonts, colors, and layout, positioned within safe zones
7. Generate captions — word-by-word with your brand highlight color, timed to speech
8. Start the preview — opens Remotion Studio so you can watch the result

Step 3: Review and Adjust

Open <http://localhost:3000> to preview in Remotion Studio. Scrub through the timeline to check every cut. Tell Claude to adjust: 'move the title up,' 'that cut at 12s is too early,' 'change the title text.' Changes appear instantly via hot reload.

Step 4: Render

When you're happy, click Render in Remotion Studio or ask Claude to run the render command. Your finished video lands in the out/ folder, ready to upload.

Time Saved Per Video

Task	Manual Time	With Claude Code
Silence removal	10-15 min	Automatic
Retake/false start detection	15-20 min	Automatic
Transcription + captions	20-30 min	Automatic
Brand title overlay	5-10 min	Automatic
Safe zone compliance	5 min	Built in
Total	55-80 min	~5 min of review

Tips

- Say 'retake' clearly between takes — it's the most reliable cut signal
- Pause for 1-2 seconds when you mess up before restarting
- Keep your brand guide updated — the more specific it is, the less you'll adjust
- Render a single frame first to sanity-check layout before a full render
- Your brand guide and rules persist across conversations — set them up once
